

Refining both integrals together, $a = 13.37$ nm, face-to-face [100], fixed potential

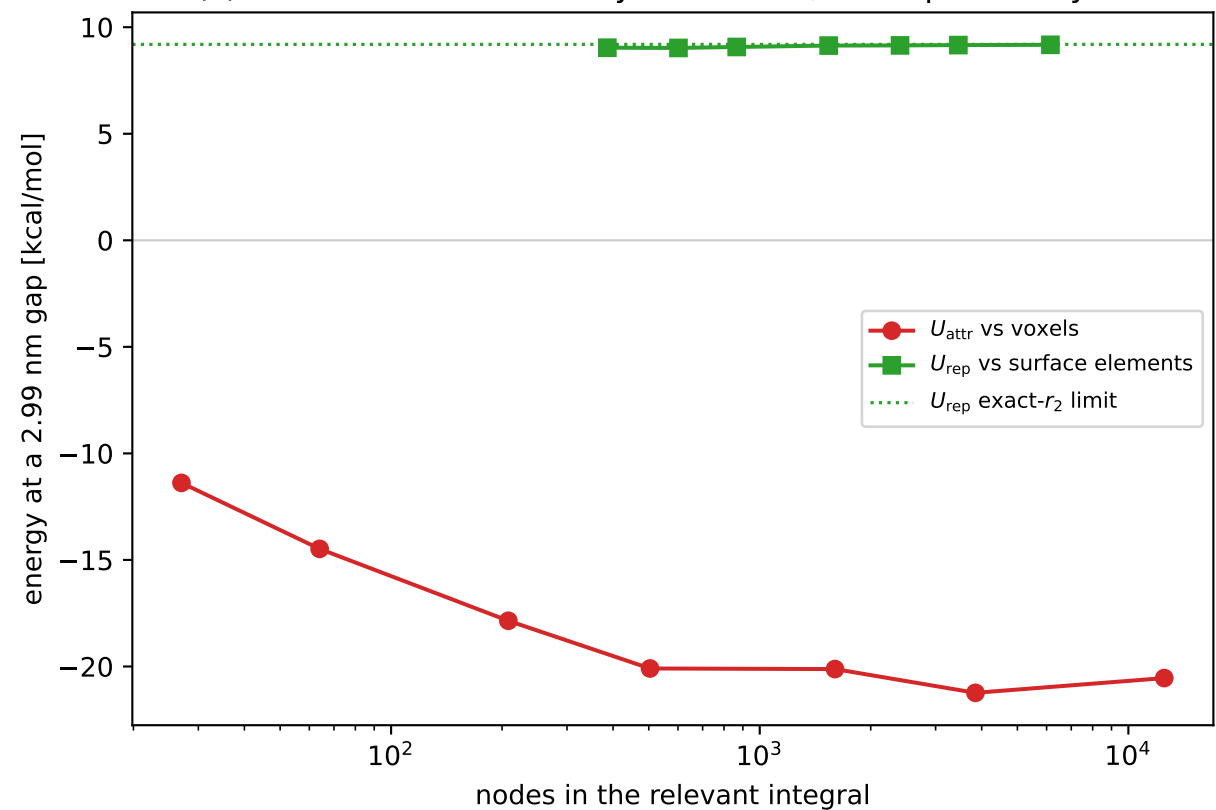

(a) both meshes refined together: the well still goes

(b) surface alone, 27 voxels held: the well SURVIVES

(c) the attraction moves by 9 kcal/mol, the repulsion by 0.8

(d) a well needs max ratio > 1: only the 27-voxel row
