

Gradual dipole freeze-in on cooling, fixed face contact
 τ_N against a 20 s window, lognormal sizes

- Experimental range
- Transient aggregation (experiment)
- monodisperse
- lognormal CV = 5 %
- lognormal CV = 10 %
- lognormal CV = 15 %
- $T_B = 250$ K
- equilibrium reference (dipole never freezes)
- $E_{vdW}^{face, pair}$ (fully frozen limit)
