

below 239 K

239-268 K

above 268 K

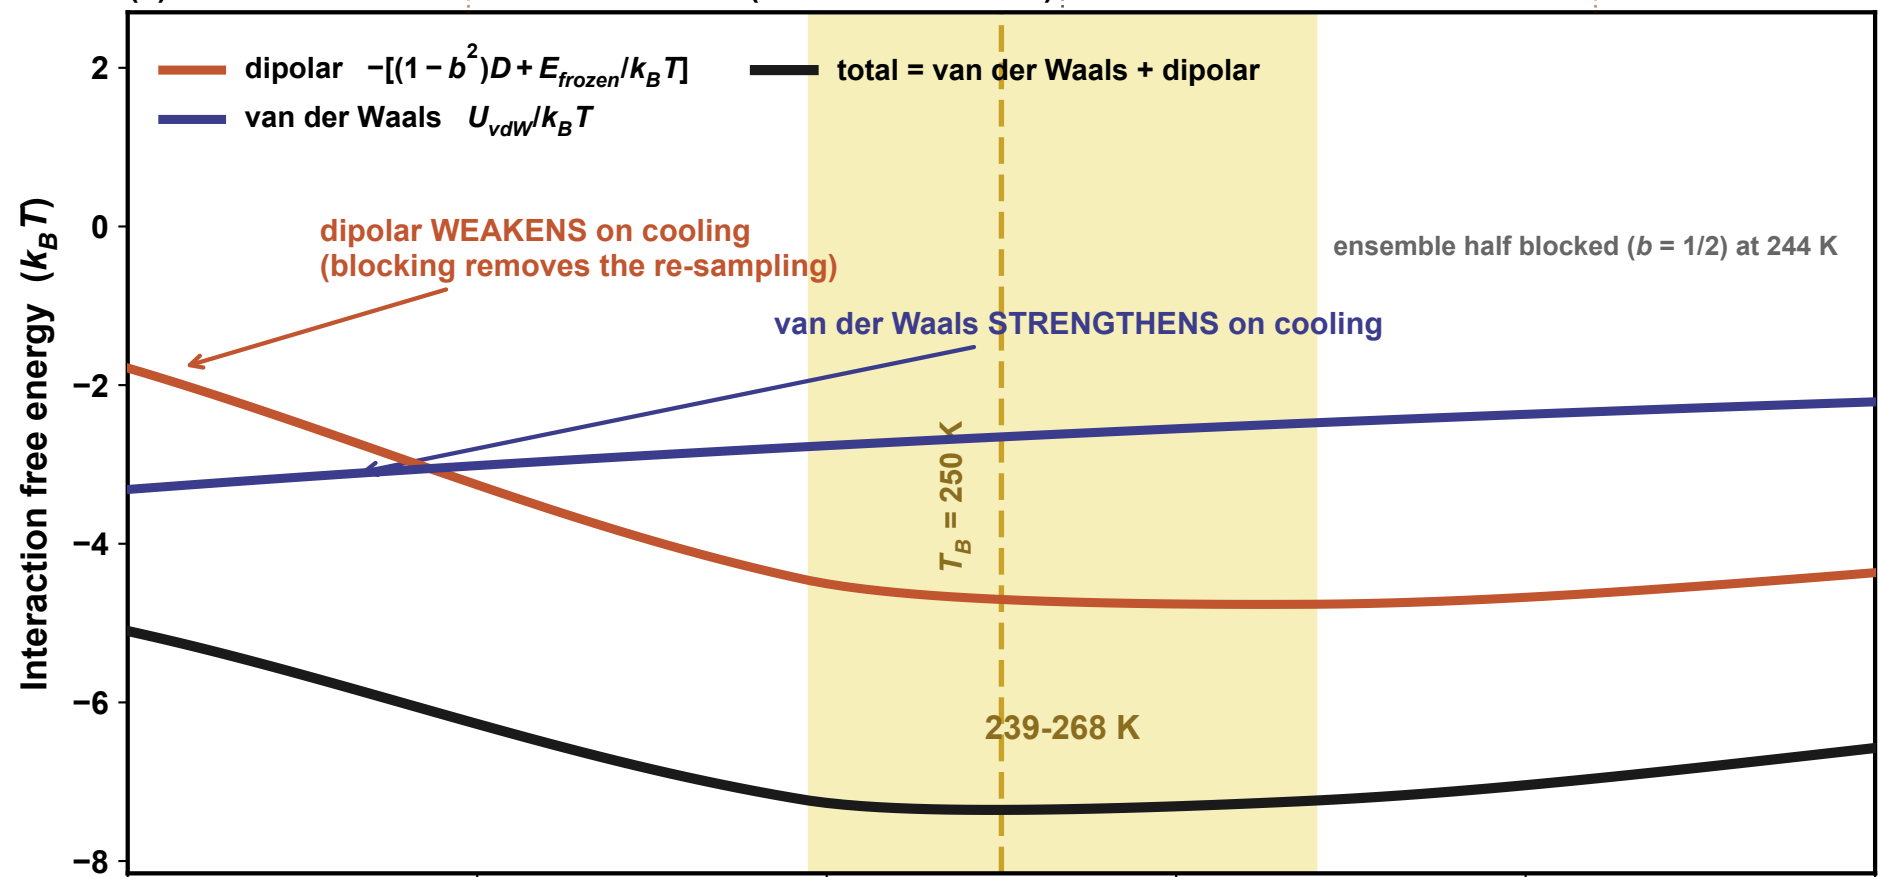

blocked at inherited random angles
→ no selection, attraction gone

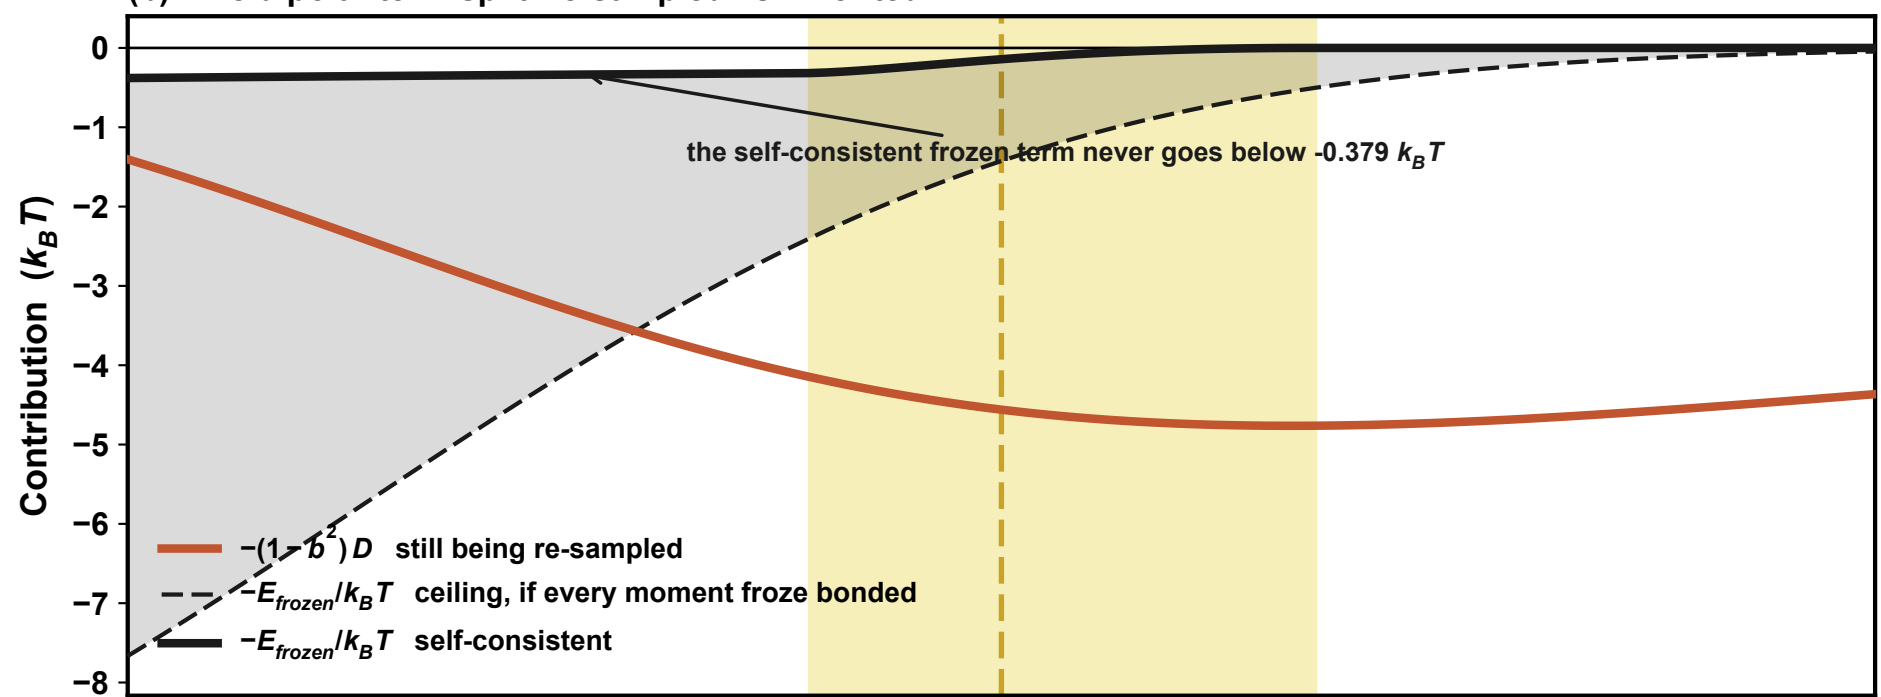

still re-sampling, picks head-to-tail
→ aggregates

re-sampling, but the well is shallow
→ single phase

(a) The two attractions and their sum (coordination $z = 1$)

(b) The dipolar term split: re-sampled vs inherited

(c) Neel blocking at 100 s dwell, CV 4.85 %, and the aggregated fraction it produces
