

Inherited, not uniform: where the pair froze decides
CV = 10 %, 20 s window, $\phi = 0.01$

- Experimental range
- Transient aggregation (experiment)
- b^2 : both moments frozen
- $T_B = 250$ K
- froze while BOUND (keeps its bias)
- computed $p_{bound}(T_{freeze})$
- froze while DISPERSED (uniform)
- equilibrium reference (never freezes)
- $E_{vdW}^{face, pair}$ (uniform-dipole limit)
